

New Bladder Cancer Clinical Research Study

Dear Patient or Caregiver,

Do you or a loved one have bladder cancer that has persisted or returned following BCG treatment?

If you are looking for an alternative to bladder removal surgery (cystectomy), the VISTA clinical research study may be an option.

The VISTA study will evaluate whether Viventia Bio's investigational drug, Vicinium™, is safe and effective for patients with bladder cancer that has not yet spread to the bladder muscle and who have previously received BCG treatment.

See if you may be eligible to participate.

Vicinium™ is a targeted therapy intended to attack bladder cancer cells while avoiding healthy bladder cells. Previous clinical studies have shown Vicinium™ to be well-tolerated.

Learn more about the VISTA study and Vicinium™ at www.MyBladderCancer.com.
